## 1 Introduction

Pour ce projet, il est demandé d'écrire un script python qui, à partir d'un fichier d'instance indiquant un ensemble de panneaux de longueur variable à découper dans des planches de longueur fixe, génère une instance de programme linéaire en langage CPLEX LP qui détermine un plan de découpe de panneaux qui minimise le nombre de planches utilisées.

## 2 Modèle

Indices :

$M = \{1, \dots, m\}$  planches

$N = \{1, \dots, n\}$  panneaux

Constantes :

$l_i$  = longueur du panneau  $i$

$L$  = longueur des planches  $j$

Variables de décision :

$x_{i,j} \in \{0, 1\}$  telle que

$$x_{i,j} = \begin{cases} 1 & \text{si une planche } j \text{ est prise pour une découpe du panneau } i \\ 0 & \text{sinon} \end{cases}$$

$m_j \in \{0, 1\}$  telle que

$$m_j = \begin{cases} 1 & \text{si une planche } j \text{ est prise pour une découpe} \\ 0 & \text{sinon} \end{cases}$$

---

**Formulation 1** Formulation linéaire

---

$$\min \quad \sum_{j \in M} m_j \quad (1)$$

$$\text{s.t.} \quad \sum_{j \in M} x_{i,j} = 1 \quad \forall i \in N \quad (2)$$

$$\sum_{i \in N} l_i x_{i,j} \leq L m_j \quad \forall j \in M \quad (3)$$

$$x_{i,j} \in \{0, 1\} \quad \forall i \in N, \quad \forall j \in M \quad (4)$$

$$m_j \in \{0, 1\} \quad \forall j \in M \quad (5)$$

---

Les contraintes (2) assurent que chaque planche a été correctement découpée. D'autre part, (3) assurent que la somme des longueurs d'un ensemble de panneaux découpés à partir d'une planche ne peut pas dépasser la longueur de cette dernière.

### 3 Fichier CPLEX LP généré

Minimize

$$\text{obj: } m\_1 + m\_2 + m\_3 + m\_4 + m\_5 + m\_6 + m\_7 + m\_8$$

Integer feasibility conditions:

KKT.PE: max.abs.err = 8.88e-16 on row 2

max.rel.err = 9.87e-17 on row 2

High quality

KKT.PB: max.abs.err = 0.00e+00 on row 0

max.rel.err = 0.00e+00 on row 0

High quality
