1 Introduction

Pour ce projet, il est demandé d'écrire un script python qui, à partir d'un fichier d'instance indiquant un ensemble de panneaux de longueur variable à découper dans des planches de longueur fixe, génère une instance de programme linéaire en langage CPLEX LP qui détermine un plan de découpe de panneaux qui minimise le nombre de planches utilisées.

$\mathbf{2}$ Modèle

Indices:

 $M = \{1, ..., m\}$ planches

 $N = \{1, ..., n\}$ panneaux

Constantes:

 $l_i = \text{longueur du panneau } i$

L =longueur des planches j

Variables de décision :

 $x_{i,j} \in \{0,1\}$ telle que

 $x_{i,j} = \begin{cases} 1 \text{ si une planche j est prise pour une découpe du panneau i} \\ 0 \text{ sinon} \end{cases}$

 $m_i \in \{0,1\}$ telle que

 $m_j = \begin{cases} 1 \text{ si une planche j est prise pour une découpe} \\ 0 \text{ sinon} \end{cases}$

Formulation 1 Formulation linéaire

$$\min \qquad \sum_{j \in M} m_j \tag{1}$$

s.t.
$$\sum_{i \in N} l_i x_{i,j} \le L m_j \quad \forall j \in M$$
 (2)
$$\sum_{j \in M} x_{i,j} = 1 \quad \forall i \in N$$
 (3)

$$\sum_{j \in M} x_{i,j} = 1 \qquad \forall i \in N \tag{3}$$

$$x_{i,j} \in \{0,1\} \quad \forall i \in N, \quad \forall j \in M$$
 (4)

$$m_j \in \{0, 1\} \quad \forall j \in M \tag{5}$$

Les contraintes (2) assurent que si une planche est utilisée pour la découpe, sa longueur doit être supérieure ou égale à la somme des longueurs de toutes les planches découpées depuis la même planche. D'autre part, (3) garantissent que chaque planche a été correctement découpée et seulement à partir d'une des planches disponibles.

3 Script Python

Le script python generate_lp_instance est un script qui, en donnant un paramètre de chemin de fichier d'instance, génère le fichier CPLEX LP approprié qui modélise le problème.

Les lignes du fichier d'instance contiennent deux valeurs :

- un flotteur représentant la longueur en mètres des planches pour la première ligne et des panneaux pour les lignes suivantes
- un nombre entier correspondant au nombre de planches disponibles pour la première ligne et au nombre de panneaux à couper pour le reste des lignes.

En parcourant le fichier d'instance, quatre variables ont été créées M, N, L et l_i telles que :

M: un nombre entier représentant le nombre de planches disponibles.

N: un nombre entier représentant le nombre de panneaux à découper

L: un flottant représentant la longueur de toutes les planches

 l_i : une liste contenant les longueurs de chaque panneau

Ces variables sont utilisées pour générer le fichier CPLEX LP adéquat.

4 Fichier CPLEX LP généré

```
 \begin{array}{c} \text{Minimize} \\ \text{obj: m\_1 + m\_2 + m\_3 + m\_4 + m\_5 + m\_6 + m\_7 + m\_8} \\ \text{Subject To} \\ \\ \text{c\_1\_1: 4.0 m\_1 - 1.5 x\_1\_1(1.5) - 1.5 x\_2\_1(1.5) - 1.5 x\_3\_1(1.5) - 1.5 x\_4\_1(1.5) - 0.75} \\ \text{x\_5\_1(0.75) - 0.75 x\_6\_1(0.75) - 0.75 x\_7\_1(0.75) - 0.75 x\_8\_1(0.75) - 0.75 x\_9\_1(0.75) - 0.75 x\_10\_1(0.75) - 0.22 x\_11\_1(0.22) - 0.22 x\_12\_1(0.22) - 0.22 x\_13\_1(0.22) - 0.22 \\ \text{x\_14\_1(0.22) - 0.22 x\_15\_1(0.22) - 0.22 x\_16\_1(0.22) - 0.22 x\_17\_1(0.22) - 0.22} \\ \text{x\_18\_1(0.22) - 0.22 x\_19\_1(0.22) - 0.22 x\_20\_1(0.22) - 0.22 x\_21\_1(0.22) - 0.22} \\ \text{x\_22\_1(0.22) >= 0} \\ \text{c\_1\_2: 4.0 m\_2 - 1.5 x\_1\_2(1.5) - 1.5 x\_2\_2(1.5) - 1.5 x\_3\_2(1.5) - 1.5 x\_4\_2(1.5) - 0.75} \\ \text{x\_5\_2(0.75) - 0.75 x\_6\_2(0.75) - 0.75 x\_7\_2(0.75) - 0.75 x\_8\_2(0.75) - 0.75 x\_9\_2(0.75) - 0.75} \\ \end{array}

5 Explication du fichier CPLEX LP généré

Le fichier généré est divisé en trois sections : Minimize, $Subject\ To$ et Binary. Dans la section Minimize nous trouvons la fonction objectif, dans ce projet cette fonction minimisera le nombre de planches à utiliser. $Subject\ To$ est une section dans laquelle nos contraintes seront regroupées, comme il n'y a pas de mots clés pour représenter une somme nous le ferons explicitement, ce qui explique les c_1j et c_2j où j est une planche appartenant à M et i un panneau appartenant à N. Enfin, la section Binary contient toutes les variables binaires utilisées dans notre modélisation, la nomenclature de ces variables a été choisie comme suit :

```
m_j: représente la planche j
x_i - j(l_i): représente le panneau i de longueur l_i découpée de la planche j
```

6 Log de GLPK obtenu

Problem:

Rows: 30

Columns: 184 (184 integer, 184 binary)
